

excellent

Quick Local Development Setup

WOW! IT WORKS!

What I was doing...

Quick Local Development Setup

One time :

- **Install a LEMP/LAMP stack on host OS. (Specific versions).**

For each new Drupal site locally :

- **Download desired Drupal Repo from drupal.org**
- **Configure the web server to point to the repo.**
- **Create a MySQL database locally.**
- **Install the site.**

Whats wrong?
